About Colibri

Colibri is an innovation teaching project, funded by the Erasmus Plus programme of the European Union, key action Strategic Partnerships.

The Colibri course is organized between 7 universities, 2 companies, and a national documentation center. It combines virtual learning with 2 weeks of physical mobility – one week in the middle and one week in the end of the semester.

The student has followed course modules, completed a project in collaboration with 2-3 students from other universities, and finally passed an oral exam including presentation, discussions and questions.

The course presents the Future Internet to students in a holistic way. The trends and future challenges are covered from a variety of perspectives with the aim of providing a comprehensive understanding of the field. Students participating in the Future Internet course will have a unique opportunity of combining technological, business, and social aspects of the Future Internet to strengthen the applicability of the knowledge acquired in real situations.

The course has the following learning objectives. Students who complete the module will obtain:

- Knowledge of the Future Internet from technological, social, and business perspectives.
- Knowledge of the wide range of disciplines involved in the Future Internet, including trends and developments.
- Skills in selected areas of the Future Internet
- Skills in exploring the opportunities in the Future Internet, by relating technical, social and business aspects, and to demonstrate this skill in one or more real-world scenarios.
- Competences in working together in teams across scientific areas, countries and cultures, and to bring into play his/her own knowledge in such a context.

More information about Colibri can be found on the webpage www.erasmus-colibri.eu.
